# Introduction

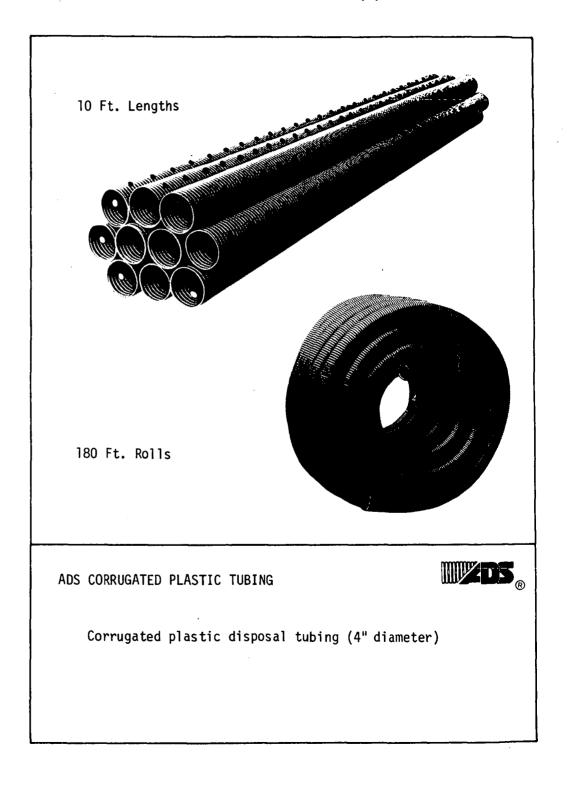

This section describes miscellaneous components for disposing of treated wastewater. Perforated bituminous fiber pipe and perforated corrugated high-density polyethylene pipe are included. The pipe conveys effluent from sewage treatment tanks through the subsurface soil absorption field. The effluent seeps out through the perforations and into the field. Clay tile (one-foot lengths of clay pipe) is also used for soil absorption fields. The tiles are laid with spacings of  $\frac{1}{9}$ -inch to  $\frac{1}{4}$ -inch to permit the effluent to seep out.

A fairly recent approach to subsurface disposal involves distribution of effluent into precast concrete chambers which are open at the bottom and which cover the absorption bed. The chambers may be installed with the tops at or below grade level. A system of vents is designed to maintain aerobic seepage conditions in the bed. Covers in the top surface of the chambers may be removed to permit access to the bed for inspection and repair. Restoration of a clogged bed can be speeded up by removing the cover and breaking up the clogging layer with a rake.

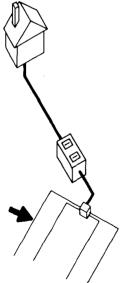

A two-way effluent diversion valve is described. The valve enables the user to switch the effluent from one soil absorption system to another in a dual installation. The alternating cycles are said to greatly prolong the lives of the fields.

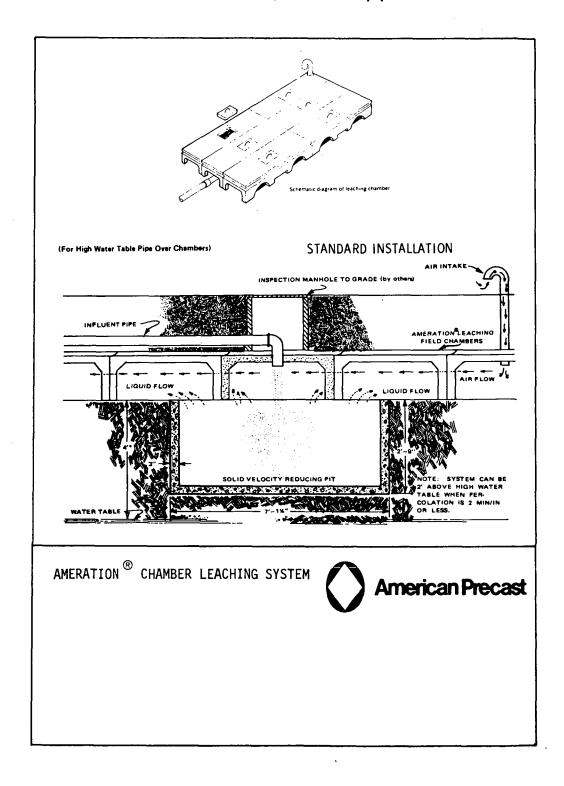

Finally, sprinkler nozzles for spray irrigation and a large tower-like rotating sprayer for the same purpose are described.

## Introduction

Reducing the amount of water consumed by a household will generally reduce the amount of wastewater generated. Less wastewater volume can be translated, within reasonable limits, into smaller treatment facilities. This can be especially important when the soil has to be used to absorb wastewater. Reduced per capita water demands can also mean that more people can be served by a well of fixed capacity or that the same population can be served by water systems of lesser capacities. Water consumption can be reduced by careful use by individuals, by reducing the amount of water that flows through plumbing fixtures, and by recycling water used for certain functions.

Water conservation on an individual level is an important aspect of water consumption reduction, but this book is concerned with items which can be designed into a household water system to reduce consumption even without the active cooperation of the homeowner. Such opportunities are presented by toilets which use less water per flush, by in-line fittings which limit the flow through a fixture such as a showerhead, by pressure reducing valves when the water supply pressure exceeds 50 pounds per square inch (psi), and by reuse of washwater and even treated water from toilets for flushing toilets.

A 1969 study by General Dynamics estimated net annual savings from various flow reduction devices as follows: [39]

| Two faucet aerators                                        | \$ 0.67            |
|------------------------------------------------------------|--------------------|
| Flow control showers                                       | 10.00              |
| Shallow trap water closets (toilets which use less water)  | 4.39               |
| Automatic flush valves                                     | 2.15-3.30          |
| Reuse of washwater (not the systems shown in this section) | -4.75 (a net loss) |

The net savings were estimated on the basis of average water and sewer charges saved, savings in fuel for heating of water, straight proration (no amortization) of capital costs over equipment lifetime, and installation costs. The estimates would vary considerably as water and wastewater treatment rates change according to local conditions.

The \$10 net annual savings estimated for flow control showers was based on a \$30 installed price prorated over fifteen years to yield \$2 per year in costs against a \$12 gross annual savings in water and sewer costs and water heating bills. If the \$12 gross saving is compared with the list price of about \$3 for shower flow control devices (which can be screwed in-line between showerhead and water pipe in a few minutes time), it is clear that capital can be recovered in less than a year. Similarly, if one estimates that water consumption can be reduced by about 15 per cent overall by installing a pressure reducing valve in a house supplied with 80 psi pressure, the savings would amount to \$10.80 annually based on a straight percentage of a \$6 monthly water bill. Since the valves cost less than \$20 to purchase, capital can be recovered in about two years for new installations and three or four years for retrofits in existing plumbing (where installation costs would be significant).

Table 23 shows two estimates of water flow reduction prospects that were made for the various household consumption profiles shown in Table 4.

| Table 23. Water Flow Reduction Estimates. | Та | ble | 23. | Water | Flow | Reduction | Estimates. |
|-------------------------------------------|----|-----|-----|-------|------|-----------|------------|
|-------------------------------------------|----|-----|-----|-------|------|-----------|------------|

Both estimates assumed that pressure reducing valves and/or flow control fittings reduced flow through shower, lavatory and sink fixtures by 33 percent. This reduction was assumed to be half-effective in kitchens, yielding about a 15 per cent reduction because about half of the water demand in a kitchen is for filling fixed-volume containers, such as sinks, pots, and kettles, and is therefore independent of flow rate. The other half is used for washing hands, rinsing dishes, and so forth, and would depend on the flow rate. No reduction was postulated for laundry use, which was assumed to be a fixed-volume demand. The two estimates differed only for toilet-flushing. The first estimate assumed a 40 per cent reduction based on using a low-flush toilet requiring three gallons per flush instead of the usual five.\* The second estimate assumed that toilets were supplied with recycled washwater and therefore that a 100 per cent saving of flush water was effected.

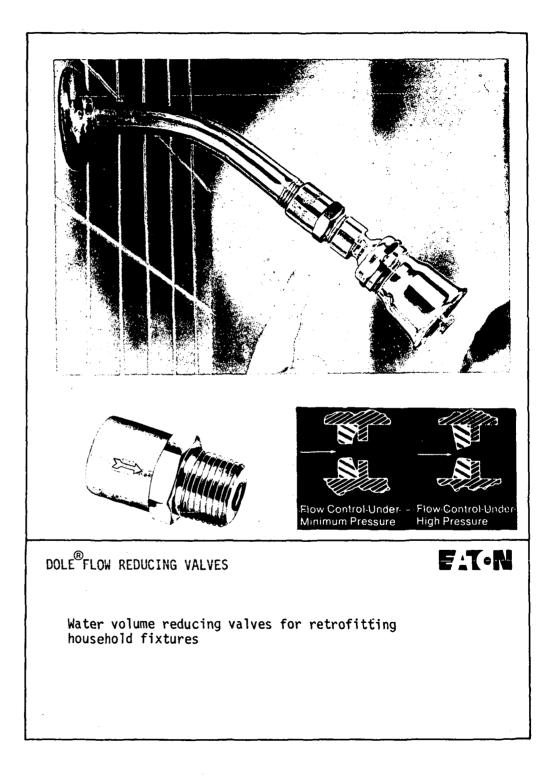

The numbers indicate that water consumption can be reduced by as much as 30 to 50 per cent (from normal consumption rates of 50 to 75 GPCD) with the use of flow reduction techniques presented in this section.

<sup>\*</sup>The low-flush toilet is offered by at least one U.S. manufacturer of plumbing equipment. It is not illustrated in this section, but is generally available through plumbing supply houses.

# Microphor

### Low Flush Toilet Treatment System Combination

This shotch poetrays the rest room facility at Rassian Galch State Park which has operated successfully. It is a new concept in providing sanitary thash toikets, a well treated efflexent and a minimum of water use. This facility restored a plugged back field and reduced the toilet restored a plugged back field and reduced the toilet stater use from 3000 to 150 gallows per day.

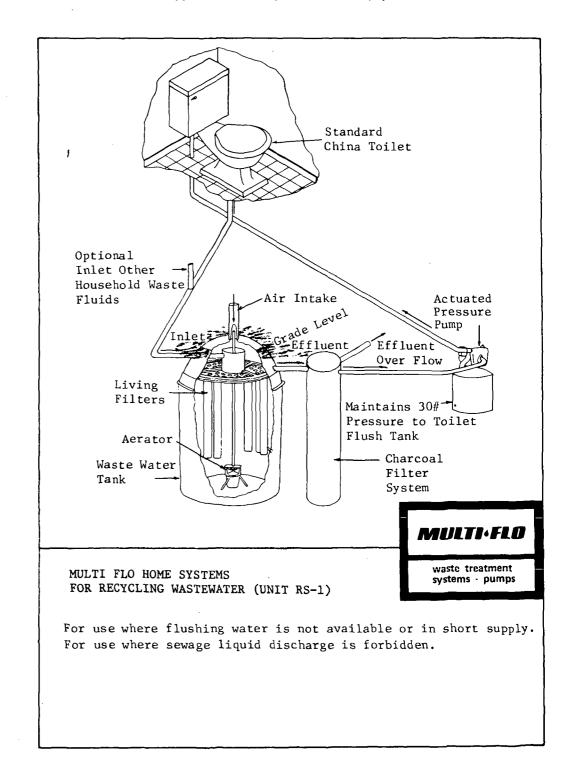

Fine Microphor Low Flush toilets were installed in place of the existing toilets. A Microphor Treatment System was buried out of sight near the building. The offlownt was conducted to an existing leach field.

There are extreme cases where the officent must be pumped from the area. In that case, Micropher efficient can be pumped economically at high presence through small pipes using open impeller pump since there are virtually no solids.

Operation: The shotch shows our Michopher Low Flush Toilet Model LF 100 CP which flushes on only 1½ quarts of water. After use, the user simply stope on the podal, which drops the waste into a hopper while clean (from water line marked 2) water cleans the bowl. Releasing the podal cleans the hopper and introduces a five second charge of compressed air (from air supply line 1). This ejects the waste through pipe 3 to the Microphor Treatment System Model O 3000. In the D.3000 the solids and dissolved organics are filtered out and a well treated effluent is discharged. At Russian Gulch this effluent was readily absorbed in a leach area that had perviously failed.

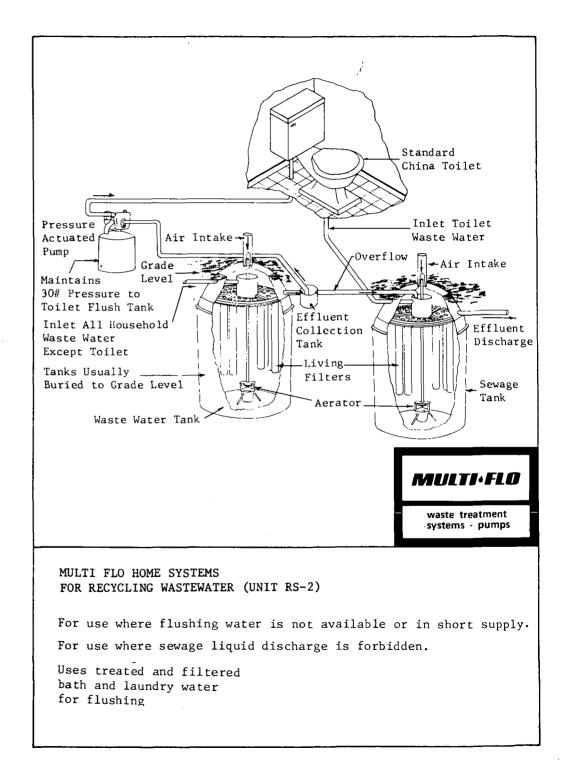

absorbed in a teach area that had perviously fuiled. Installation: In existing facilities the standard toilets are removed and the Microphor Model LF 100 CF is bolted in place. The air compressor and air lines (marked 1) are installed. Water at city pressure is connected to hose (marked 2). Waste discharge pipe (marked 3) is usually 1½? PVC schedule 40. The treatment system can be up to fifteen fort away and up to twenty-four inches higher than the toilets.

## Accessories

# Introduction

BIF Waste Disintegrator—Hydraulic Waste Disintegrator, 310 **BIF Sanitrol** BIF Lagoon Monitor-Lagoon Flow Monitoring System, 312 **BIF Sanitrol** Flygt ENH-10-Mercury Switch Liquid Level Sensor, 314 Flygt Corporation Level Sensor---Mercury Switch Liquid Level Sensor, 316 Franklin Research Coli-Count-Water Tester for Bacterial Contamination, 318 Millipore Corporation Neo Comminutors-Sewage Comminutors, 320 Nishihara Environmental Sanitation Research Corp., Ltd. Activator-Sewage Comminutors, 322 Pollution Control, Inc.

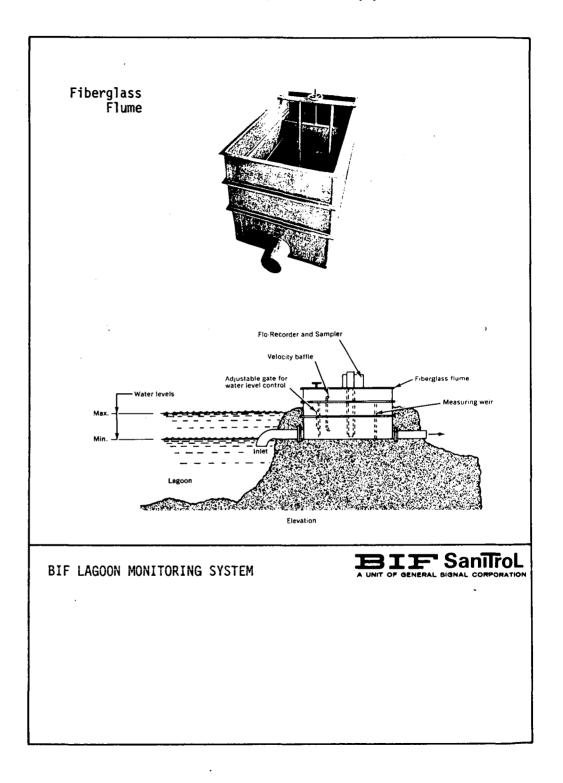

This section contains a miscellany of accessories for use in sewage treatment systems. Included are grinders (comminutors), level-sensing switches, a lagoon-flow monitoring device, and a self-contained portable test kit for performing microbiological analyses (for determining the adequacy of sewage disinfection procedures, for example).

**BIF SANITROL BIF LAGOON MONITOR** P. O. BOX 41 LARGO, FLORIDA 33540 (813) 584-2157 Attn: Mr. Norman Smith, Vice-President, Sales LAGOON FLOW MONITORING SYSTEM **FEATURES** OPERATION Fiberglass flume (up to 1000 GPM) placed at lagoon discharge point; can be outfitted for lagoon level control, flow re-cording and sampling; optional disinfection equipment. 1. Lagoon discharge flows into flume, with base of flume at minimum lagoon level. Adjustable gate for water level controls discharge. coroing and sampling; optional disinfection equipment.
2. Measuring weir and adjusting gate meets most state health authority requirements for weed and pest control.
3. Can record volume on a daily, monthly and accumulated basis.
4. Provides 30 day strip chart for graphic indications of flow. Gravity Flo-Recorder measures flow.
 Flo-Ratio Sampler lifts samples either on flow and/or time basis with came on a program rotor (8 to 1 range). 5. Refrigeration unit can stabilize biological contents for sampling. COSTS (DOLLARS) UTILITY REQUIREMENTS MODEL BATED TANK ΕĒ (GPM) GAL. 3G. LIST ELECTRICITY (LB.) INSTALL OPERATE WIDTH MAJOR ENGTH HEIGH FOR (YRL) COST CORT (BATING) 60-111 Flume Fiher Un to 110 ¥ AC<sup>1</sup> 6' 3'6" 3' 6" NA 1072 Varies 1000 a lass <sup>1</sup>Or DC operation with recorder. INSTALLATION REQUIREMENTS SIZING & GROWTH POTENTIAL Installation of flume requires excavation and pipe connection at discharge point in lagoon shore.
 Electrical and plumbing skills required for installation of components; flume involves simple installation. Flumes available in sizes starting at 12" x 48" x 16" Ø 100 GPM to 1000 GPM; made to customer specifications.
 Parallel installations available for larger or multi-discharge applications. COSTS **OPERATION & MAINTENANCE REQUIREMENTS**  List price includes fiberglass flume only; control gate for lagoon level control, flow recorder and sampler are optional Periodic inspection and controlling at equipment; extended automatic unattended operation possible. additions STIOOOB Flow Recorder: \$1055 with 4 ft. extension and 30 day strip chart and totalizer; ST41-2 Sampler (5 ft.), \$705. TECHNICAL PERFORMANCE-OUTPUT MODEL STANDARDS OPERATING NOISE RANGES (TEMP, OTHER) 6 000M CODES MET INALION: 8 00 000 800<sub>8</sub> WARRANTIES, GUARANTEES, & SERVICE TECHNICAL PERFORMANCE Warranty on parts and workmanship.
 Distribution through locally licensed dealers of sewage treatment and control equipment. ACCURATE AS OF July 31, 1972 COMMENTS 1. More information available from manufacturer on samplers, recorders, sensitizers, refrigeration sampling, etc.

None

POLLUTION CONTROL INC. ACTIVATOR N. WING, LUNKEN AIRPORT ADMINISTRATION BLDG. CINCINNATI, OHIO 45225 (513) 871-2754 Attn: Mr. Fred Tipton, Vice-President **SEWAGE COMMINUTORS** FEATURES OPERATION EATURES
1. Notor driven aluminum comminuting device for in-line flow-through disintegration and reduction of waste particles to 1/4" or smaller with 12-1/4" cutter teeth.
2. Westinghouse 1/2 HP right angle gear motor; integral type with single reduction worm gearing Class Ko. 3.
3. Programmed timing control stops unit in case of clogging, overload protection circuitry.
4. Sewage can overflow through top inlet trough to flow chamber and discharme in zeas of nonce failure Sewage enters comminutor through open top inlet trough. Large pieces are sheared and ground between stationary and 2. Large pieces are sheared and ground between sectionary of revolving cutter teeth.
 Ground sewage (less than 1/4") passes through revolving sewage screen to discharge at bottom of housing.
 Overflow passes through open top inlet to flow chamber Tocated outside of comminutor prior to treatment or pumping (in case of breakdown or over-surge). and discharge in case of power failure. 5. Revolving aluminum screen with 4 adjustable cutter teeth. DINEMBONE COSTS (DOLLARS) UTILITY REQUIREMENTS TANK DESIGN MODE OPERATING PACIT APACIT LIFETIME NUMBER UGG. LIST INSTALL WATER (LB.) P-8 140 0-300 .... <sup>1</sup>Minimal flow-through pressure necessary. INSTALLATION REQUIREMENTS SIZING & GROWTH POTENTIAL P-5 has 6" ID inlet with 11" flange and 5 1/8" outlet; P-8 has 8" ID inlet with 12 1/2" flange and 8 1/8" outlet. (Return 1. Both sizes available with 180° return elbows (continued inline flow; same direction). 2. Drive shaft extensions from motor to comminutor available for elbow outlet has same dimensions as inlet.) 2. Electrical and plumbing skills needed for installation. greater flexibility. **OPERATION & MAINTENANCE REQUIREMENTS** COSTS Extended drive shafts and return elbows are optional extras.
 Electrical costs are for 1/2 HP continuous operation. 1. Periodic maintenance necessary; included in package plant service contract. TECHNICAL PERFORMANCE-OUTPUT MODEL OPERATING STANDARDS NOISE (R + % REDUCTION, A + ACTUAL VALUE) BANGES -----CODES MET (MAJOR) TEMP, OTHER 800, 88 DO CO0 40 tor Temperate: 8-5 NA NĄ NA NA outdoor noise. AGMA operation No odors ... ... ... . п ... P-8 WARRANTIES, GUARANTEES, & SERVICE **TECHNICAL PERFORMANCE**  Gear motor approved by American Gear Manufacturers Assoc.
 P-5 nrovides up to 707 in/lb of torque @ 35 RPM and P-8 up to 773 in/lb of torque @ 23 RPM. 1. I year warranty on parts for defective material or workmanship to be determined by manufacturer. All labor costs extra. 2. PCI distributors offer plant service contracts covering comminutor maintenance. OMMENTS ACCURATE AS OF July 31, 1972 1. Each comminutor furnished with spare set of stationary and rotating cutters. COMMENTS NOTE: The above data are based on information supplied by the manufacturer. Demonstration Water Project cannot assume responsibility for their accuracy. Please contact manufacturer for latest specifications and prices.
